

(問題)

$$45 + 18 \times (27 - \square) \div 6 = 111$$

(解説)

$$45 + 18 \times (27 - \square) \div 6 = 111$$

$$45 + \boxed{\quad} = 111$$

$$\boxed{\quad} = 66 \quad 111 - 45 = 66$$

$$18 \times (27 - \square) \div 6 = 66$$

$$(27 - \square) = 66 \times 6 \div 18$$

$$27 - \square = 22$$

$$\begin{aligned}\square &= 27 - 22 \\ &= 5\end{aligned}$$

5
